

# dimensions of a battery

**Guy Holding**  
enspired

warranty terms: what to consider  
for cross-market optimization

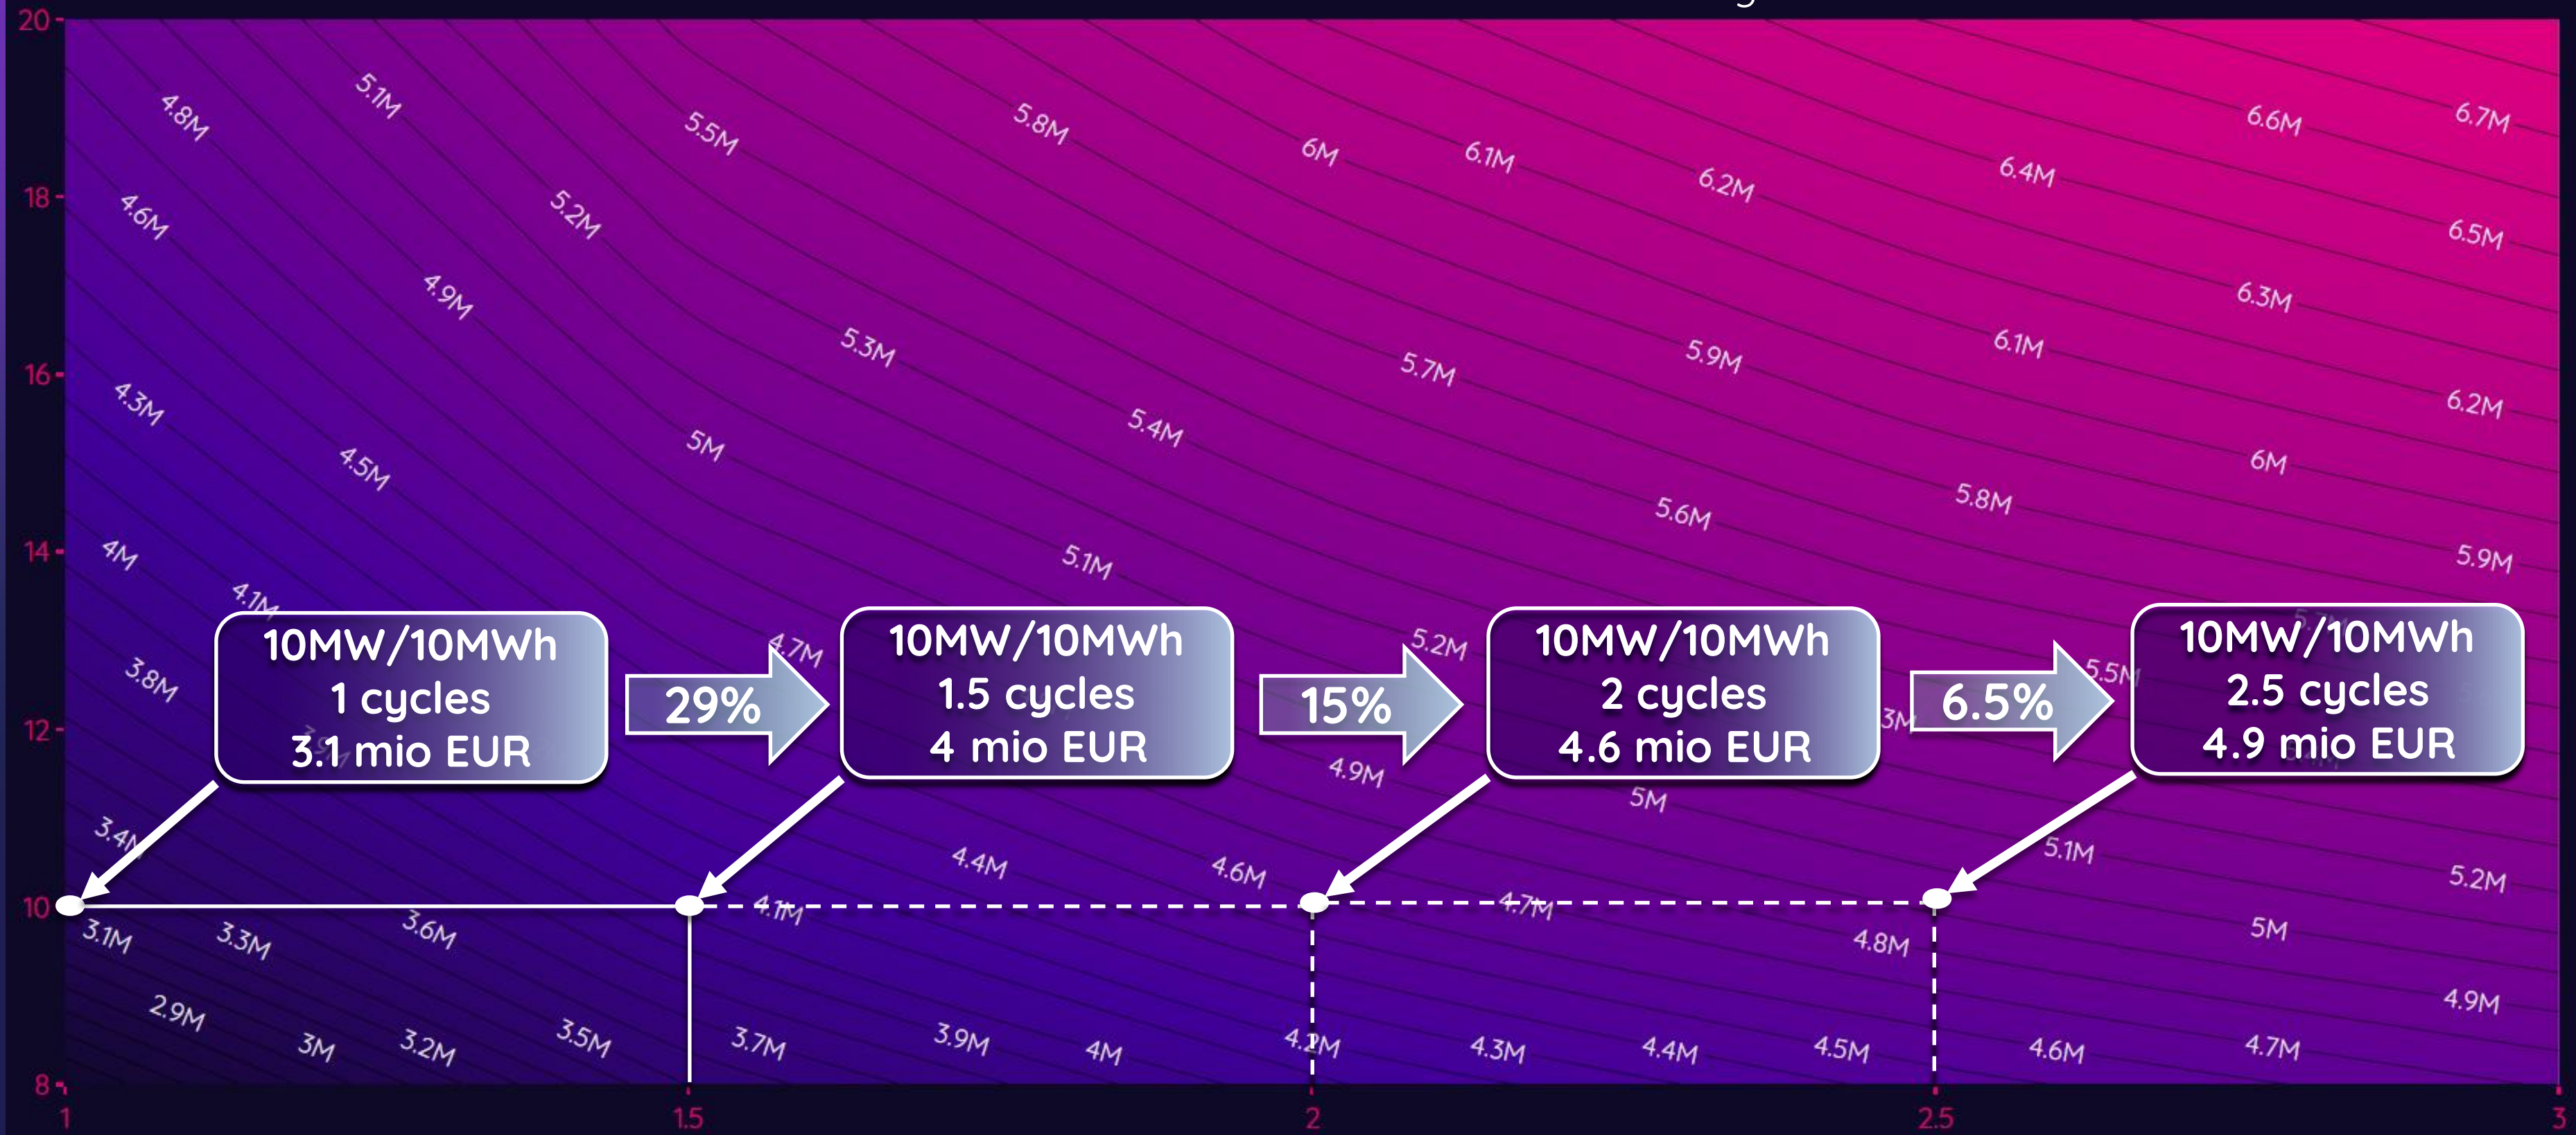

battery sizing: impact of cycles,  
duration and degradation

# warranty terms

## impact of cycles on cross-market revenues

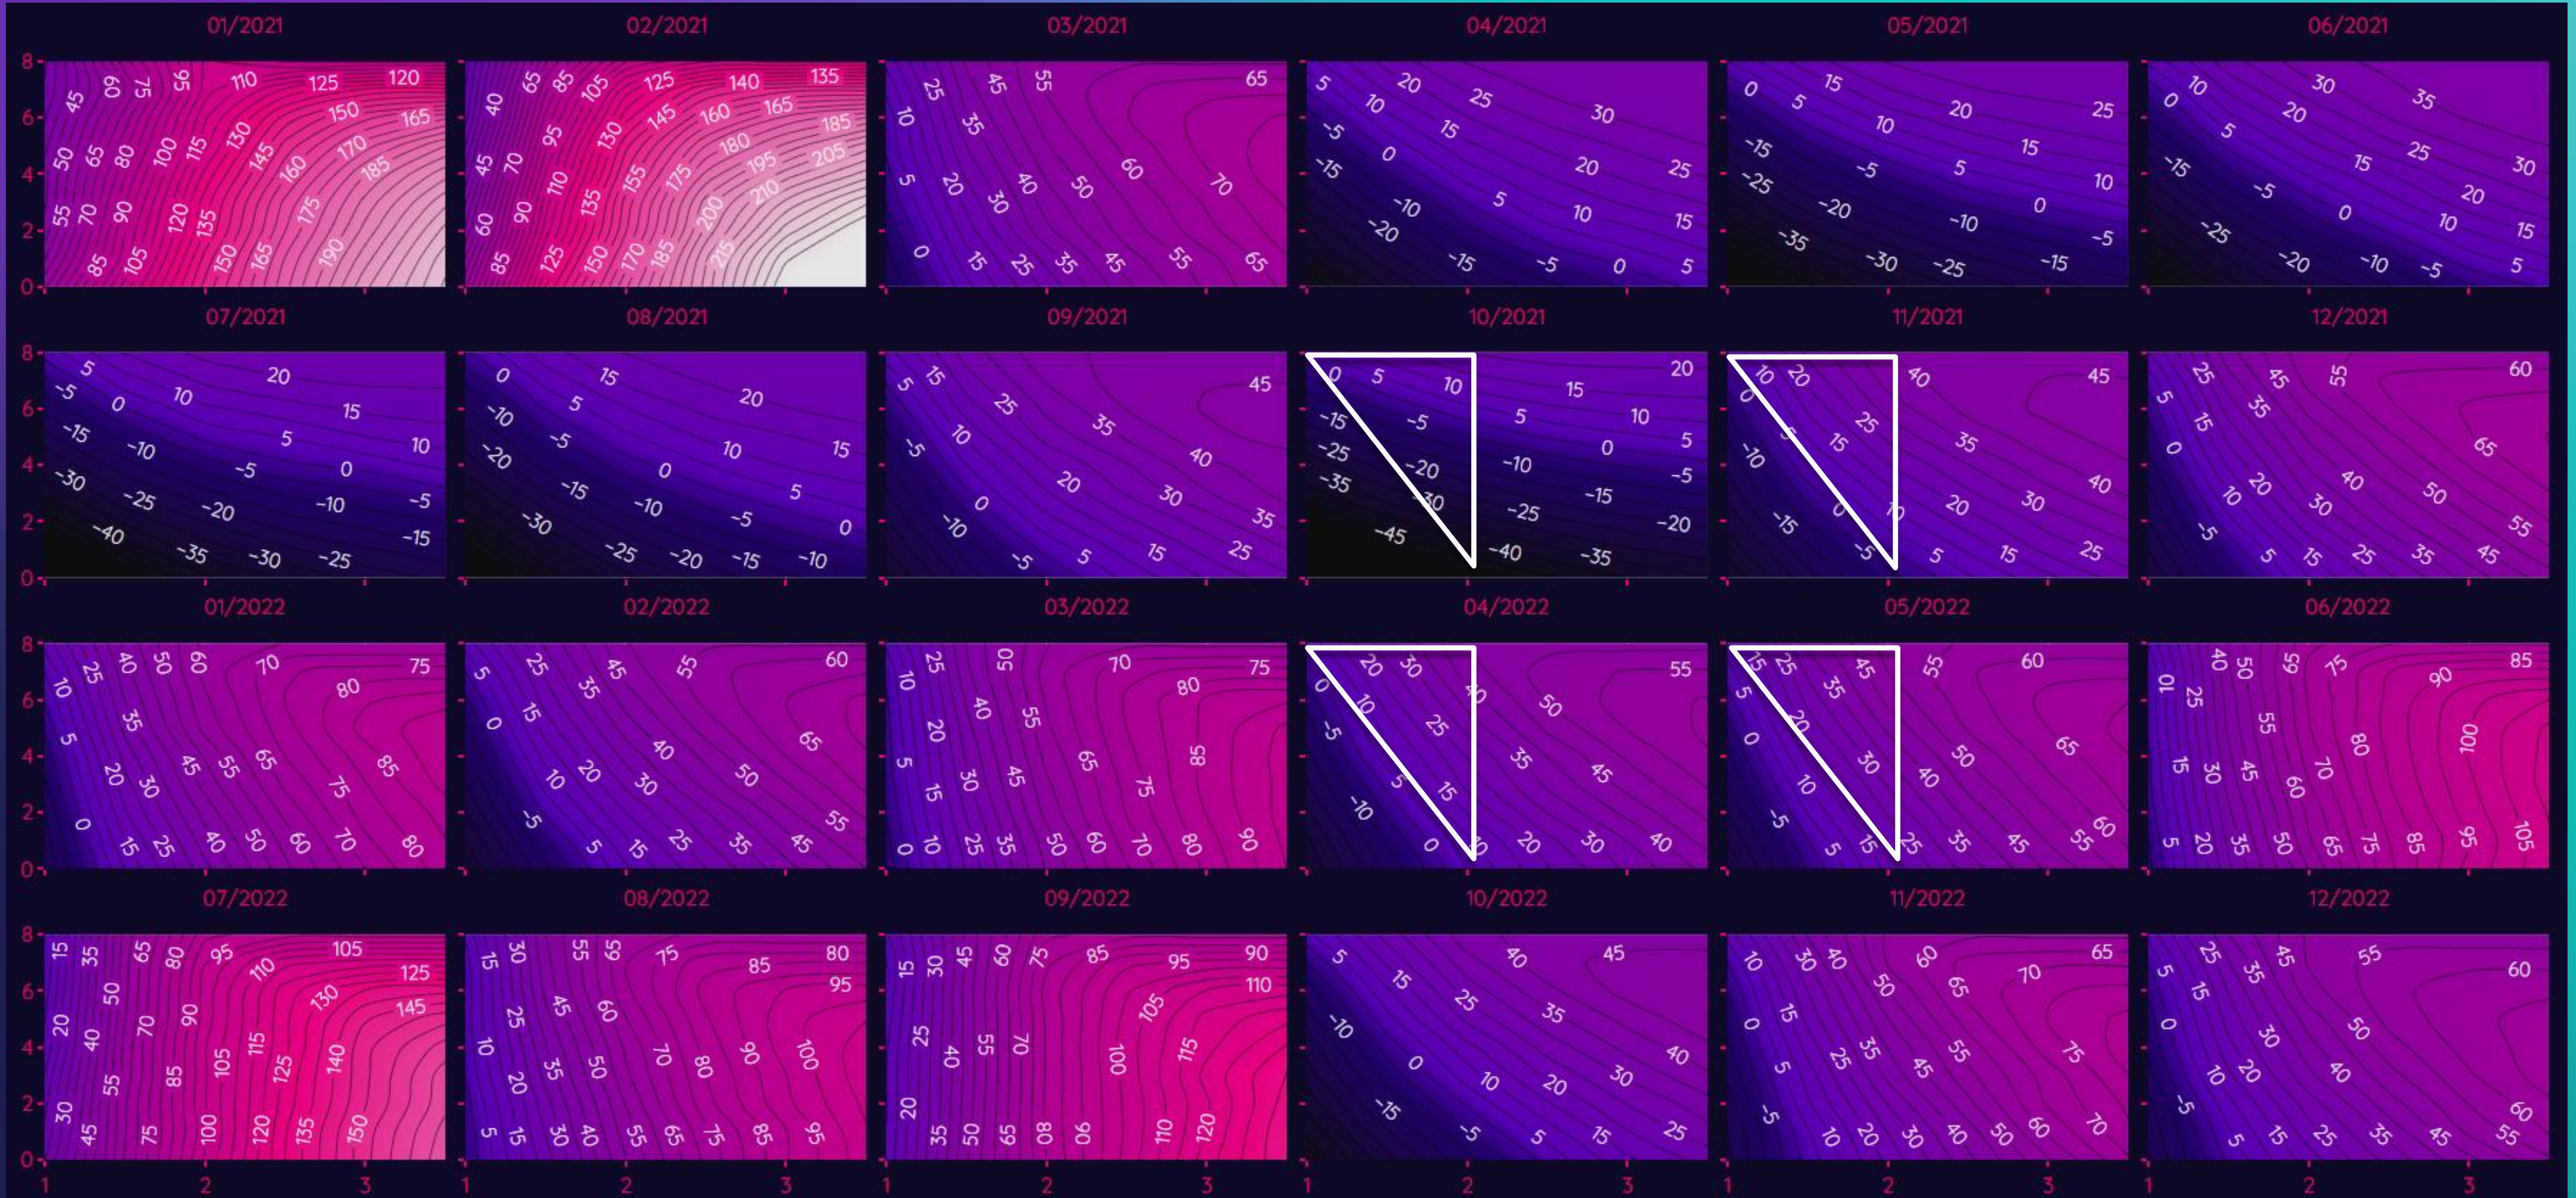

24 months of revenue with a 10MW battery

# warranty terms

## impact of cycles on cross-market revenues

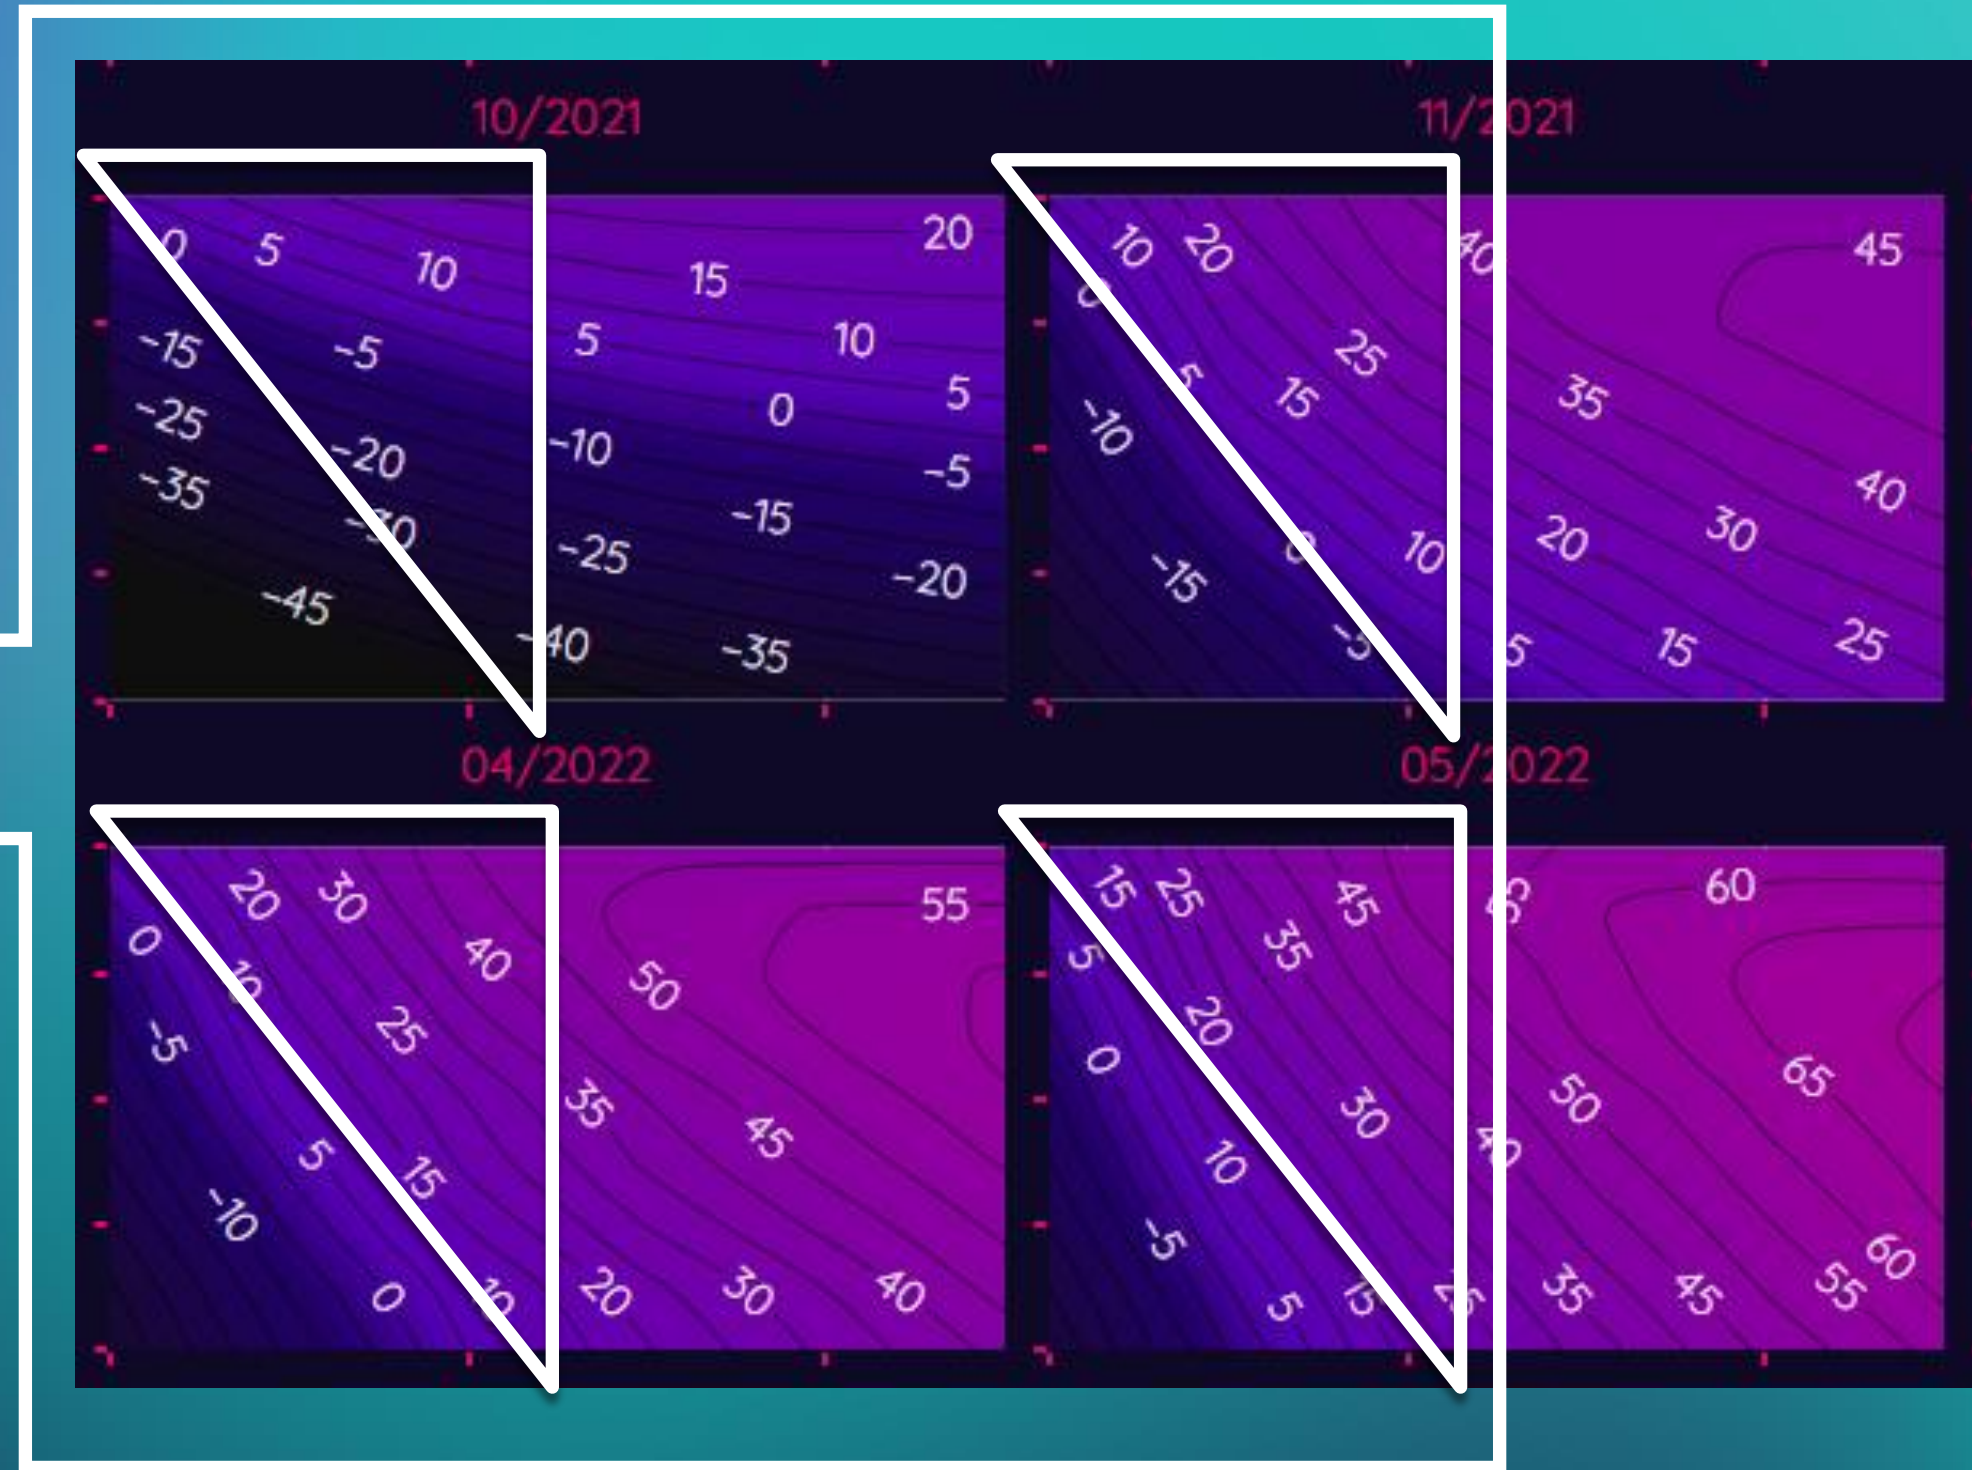

warranty terms

impact of cycles on cross-market revenues

2 cycles are a good choice ->  
more cycles, more options to combine  
and stack revenue streams

warranty terms

**cycles => throughput and temperature**

**temperature: don't let poor air conditioning limit your revenues**

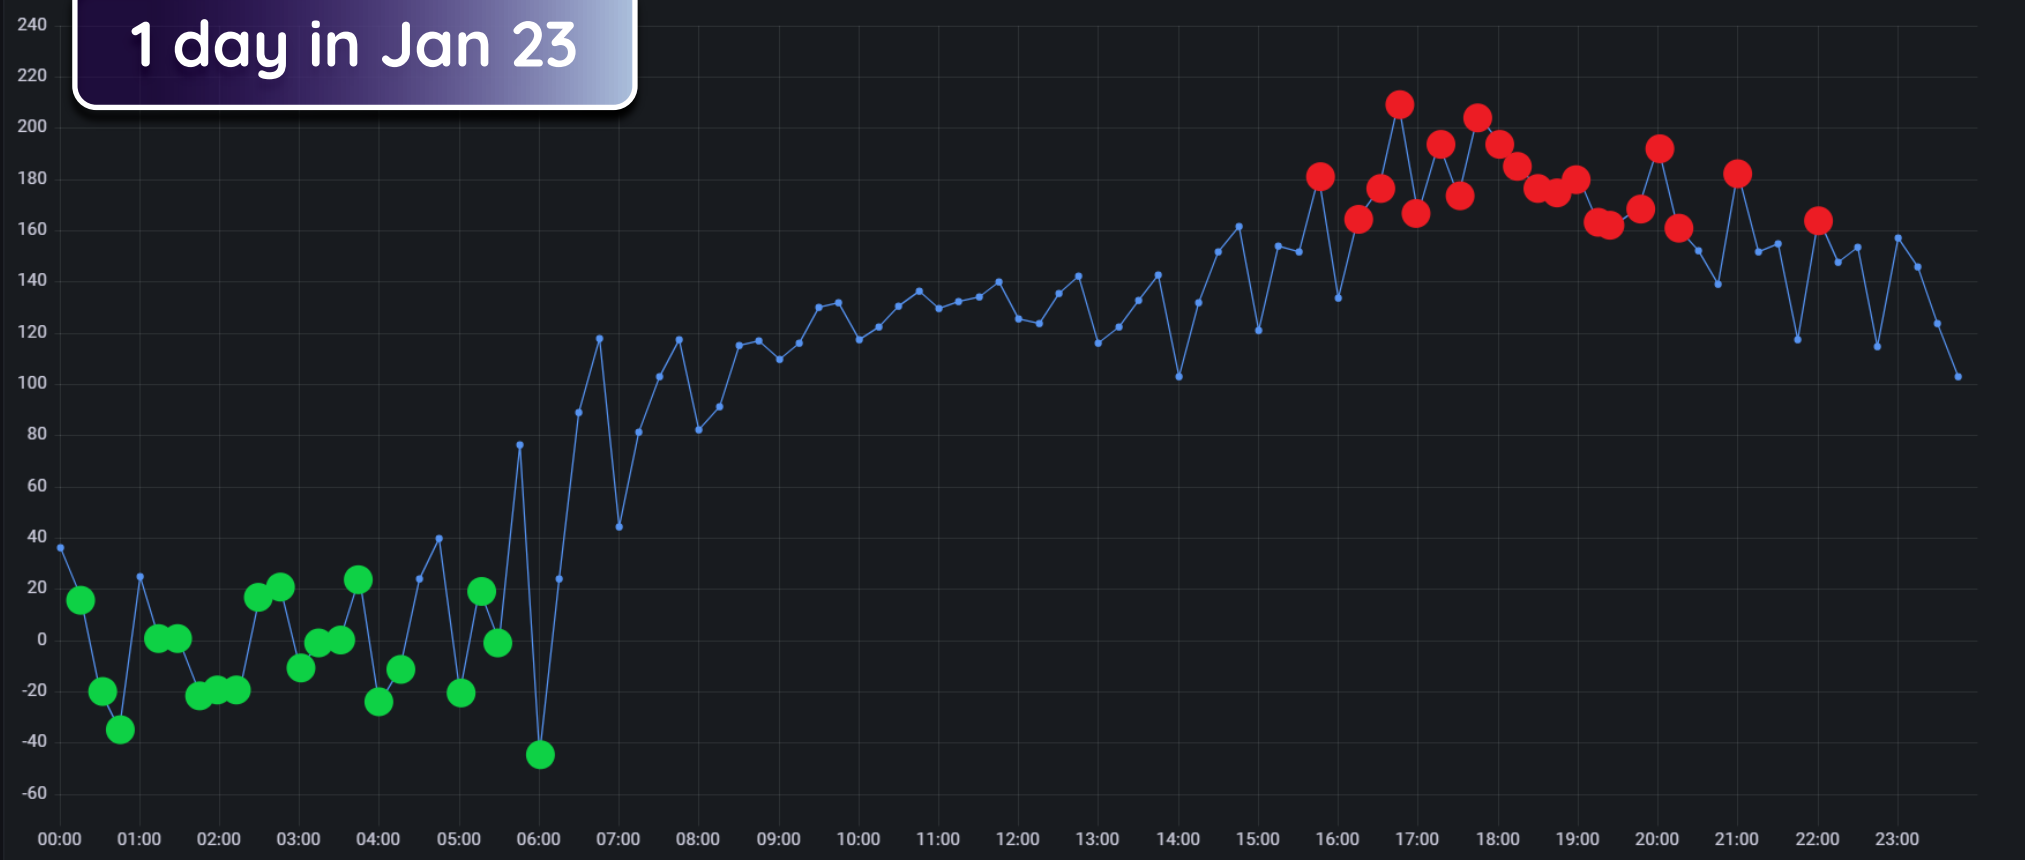

**annual throughput: must match number of cycles and MWhs**

# what is more important cycles or duration

1 day in Jan 23

Epex Intraday Auction Price

## duration

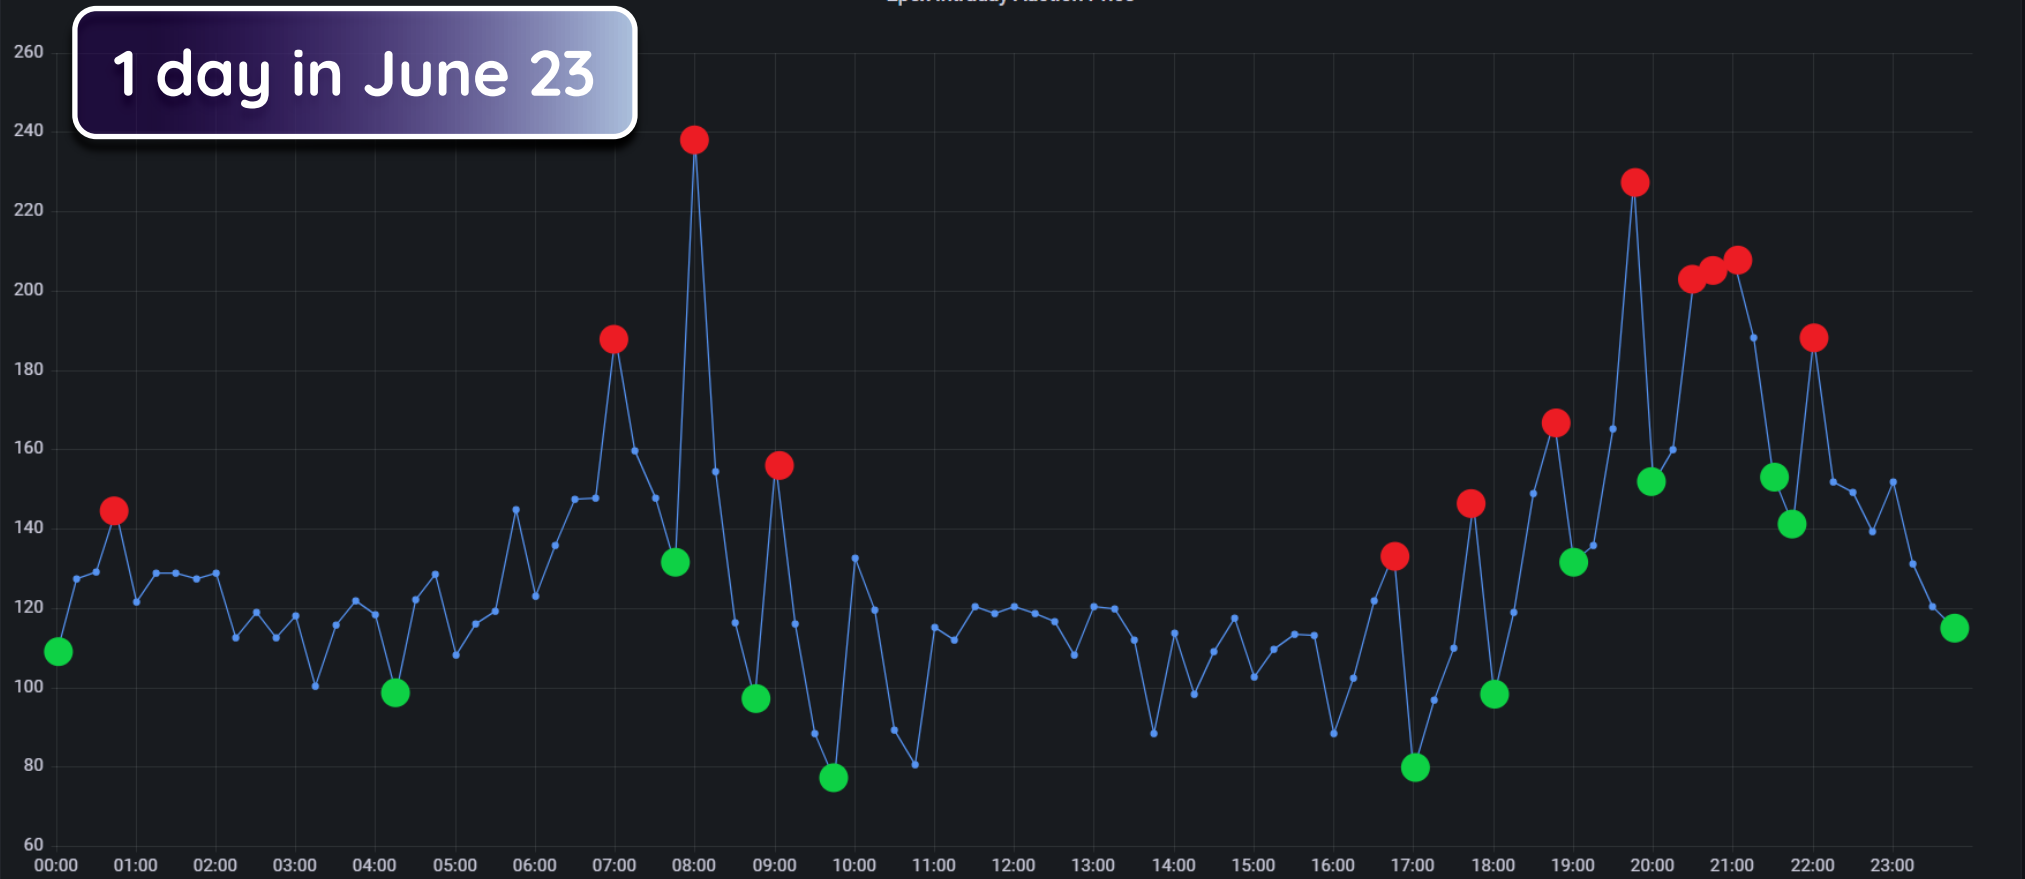

no big deltas between quarter hours  
buying in the morning and selling in the evening

only one cycle is needed but a long duration would be perfect: 20 quarter hours (5h) buying and 20 quarter hours selling

1 day in June 23

Epex Intraday Auction Price

## cycles

in the morning and evening more than 4 quarter hours to charge and discharge -> 2 cycles +

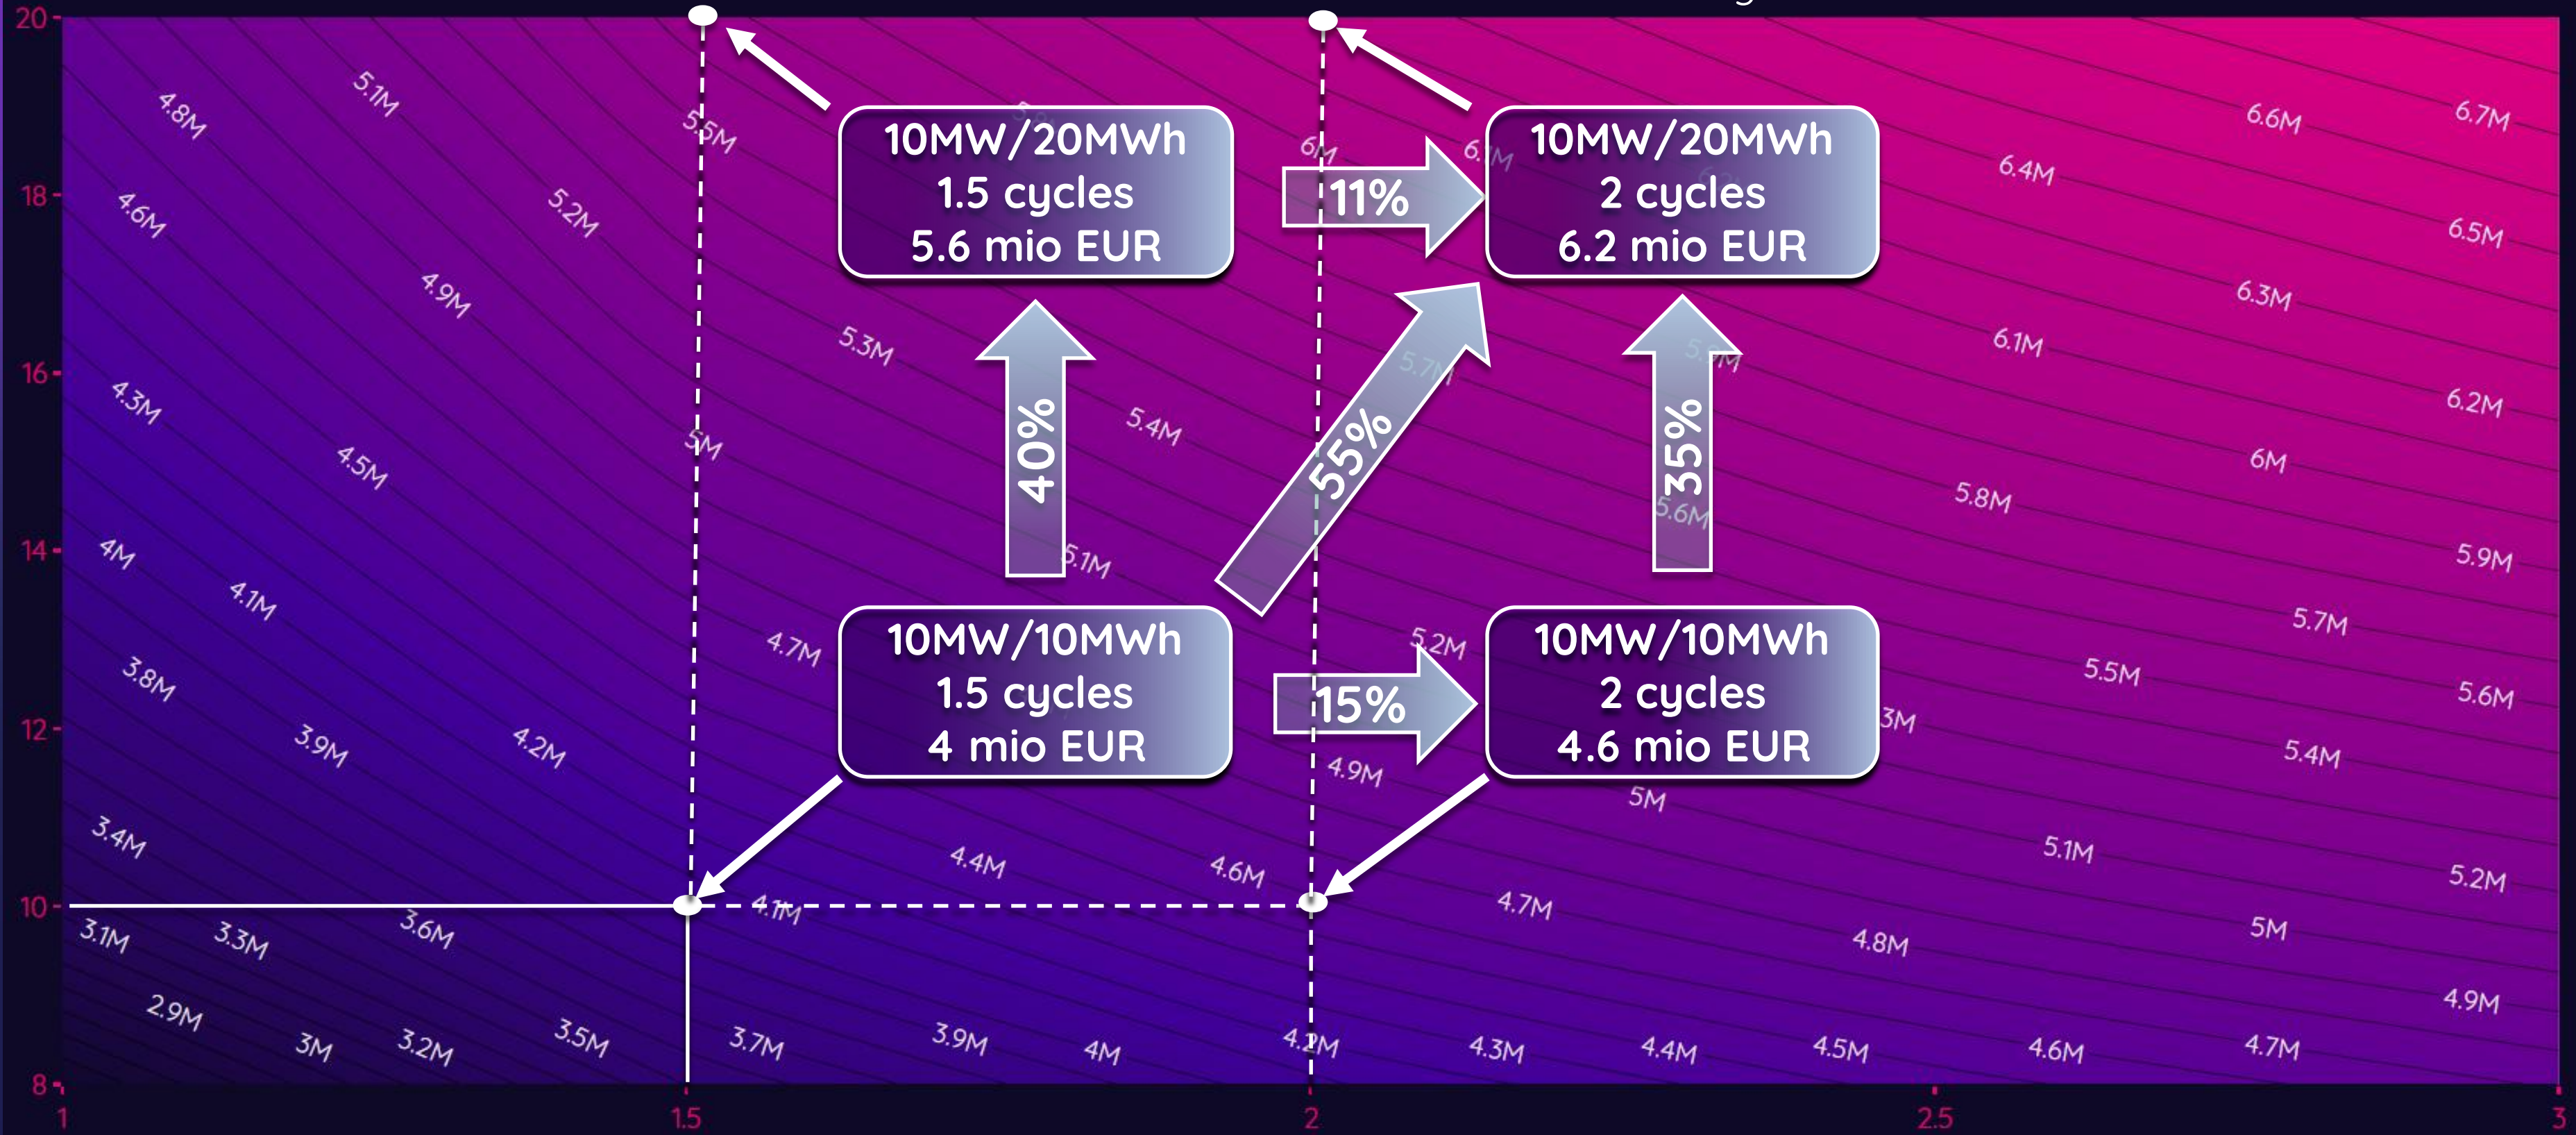

in this scenario cycles are important, but the duration is not that relevant

# duration of batteries

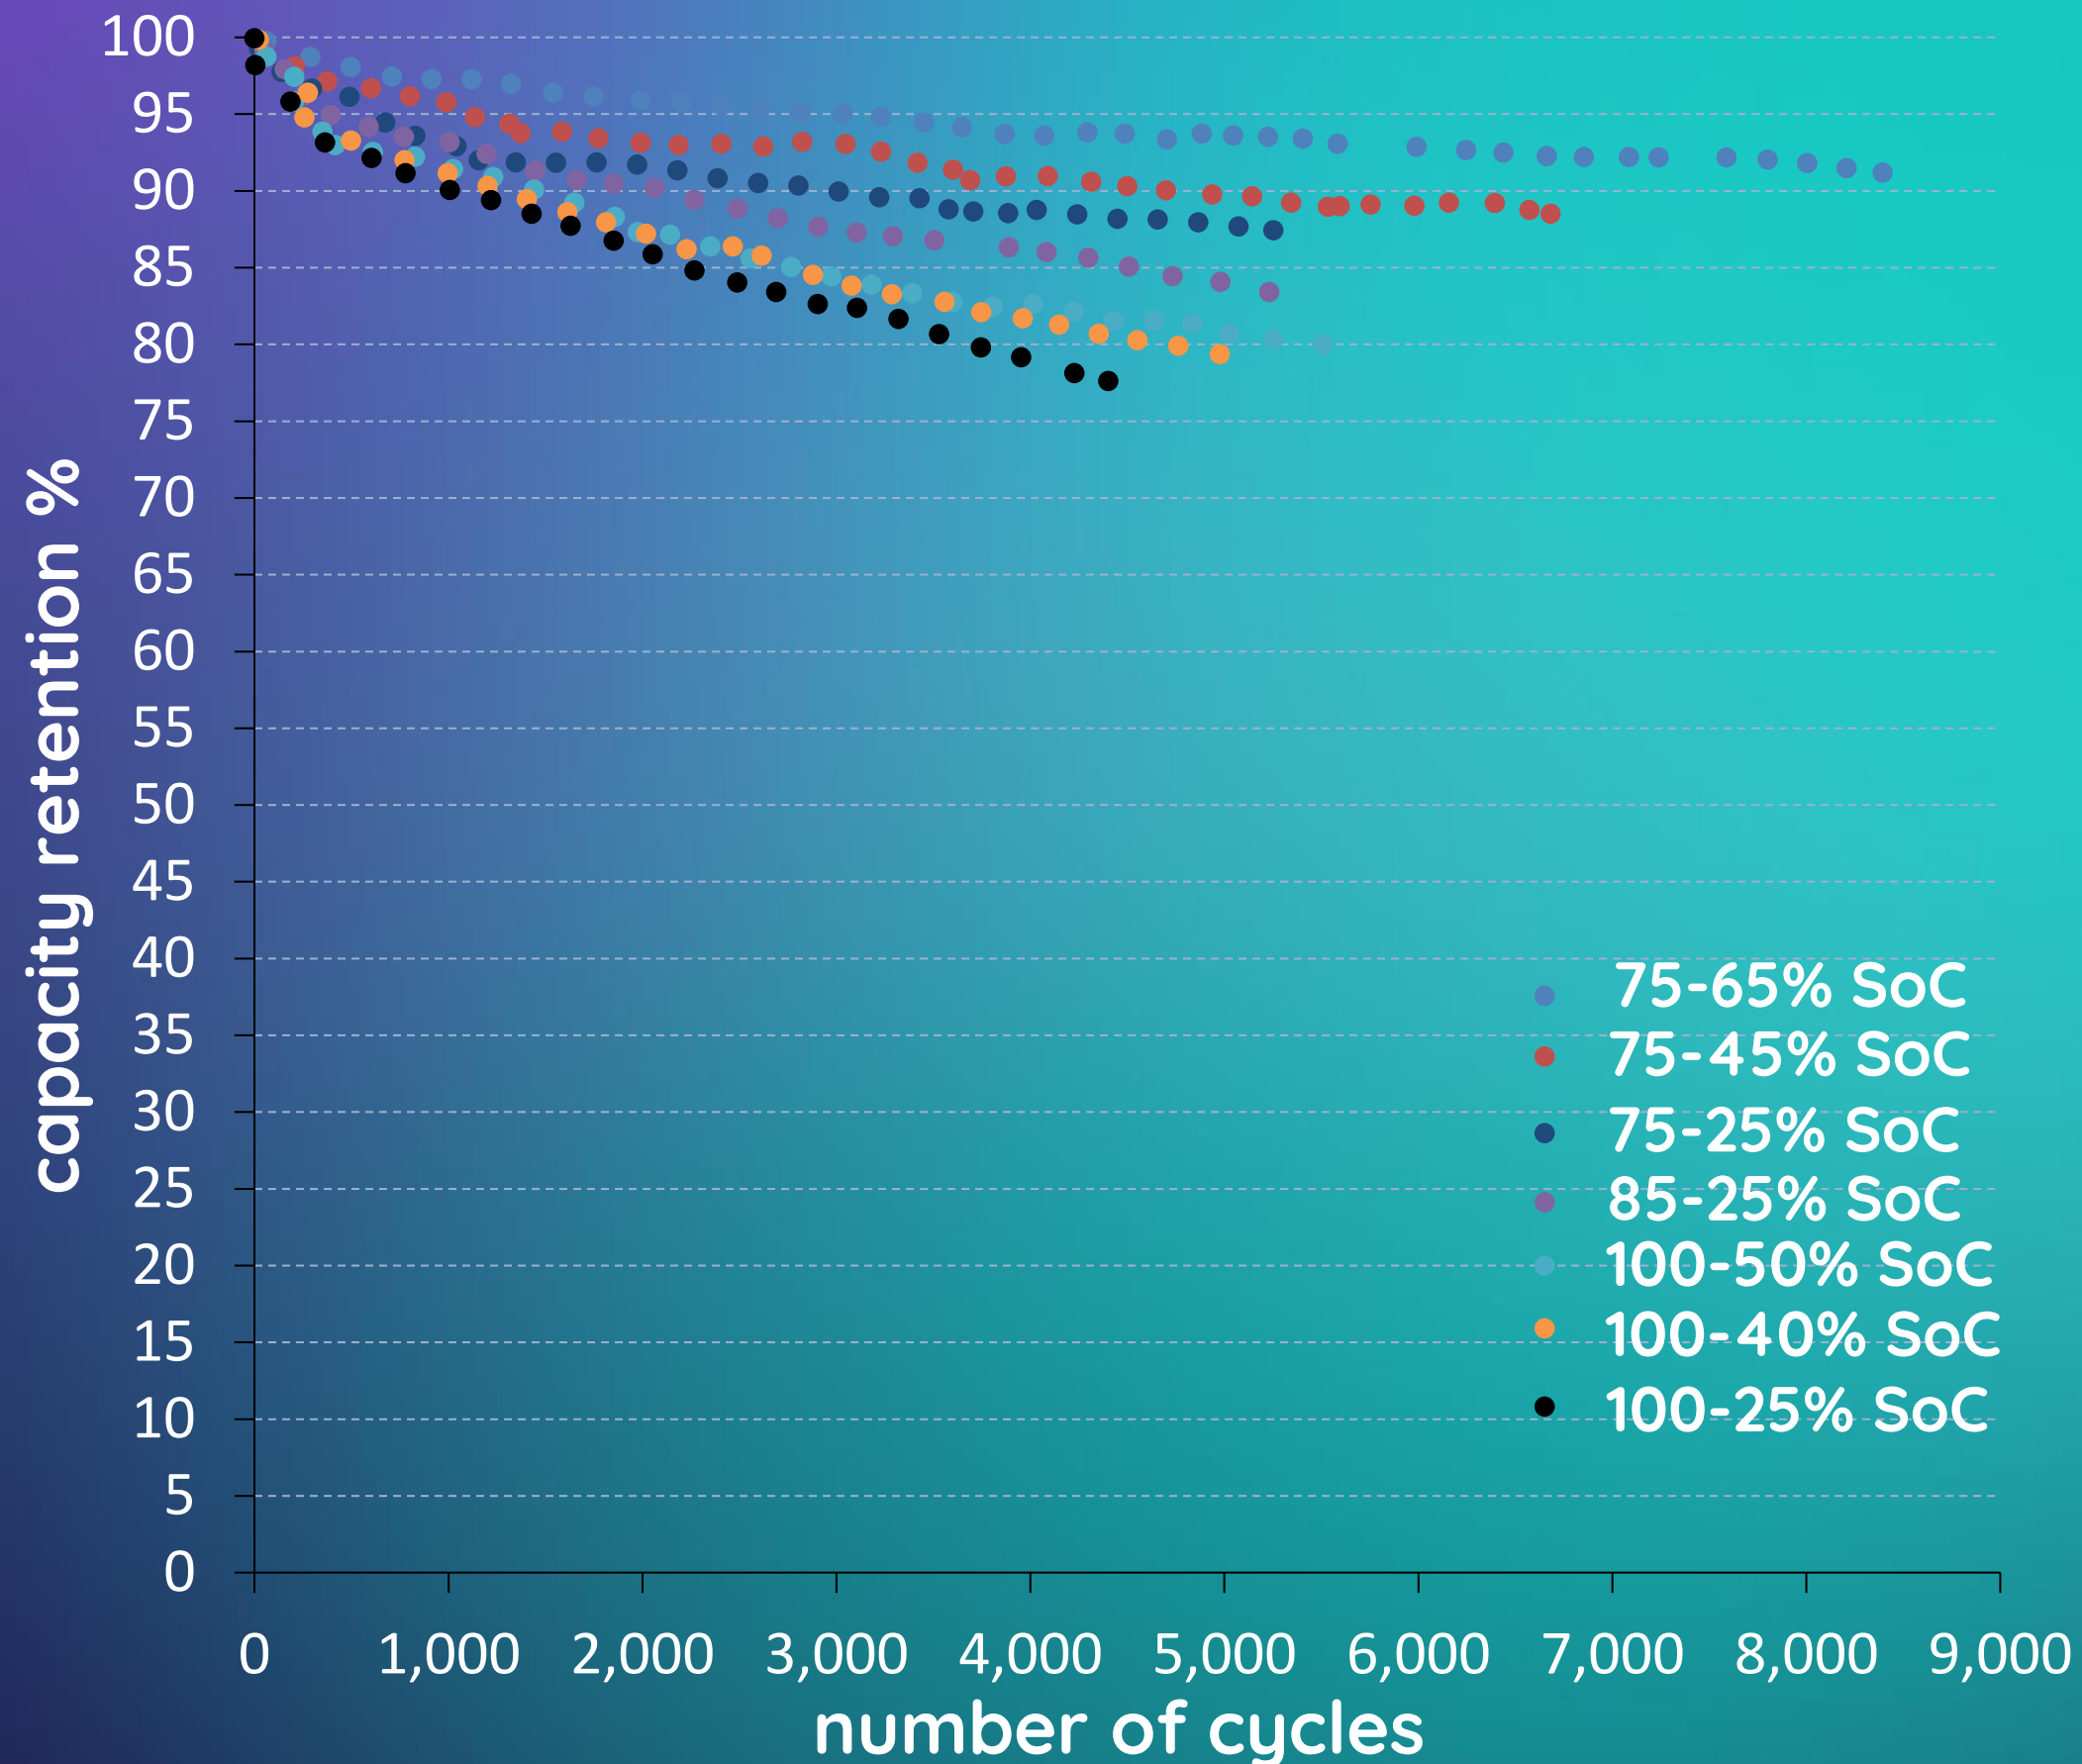

1h, 1.5h or 2h - not an easy decision

24 months of revenue with a 10MW battery

# degradation influence of cross-market optimization

-  longer duration gives you freedom to market the battery in a preferred SoC range
-  finding the optimal SoC range to maximize revenues and keep batteries healthy
-  trading strategies can be adapted to optimize the SoH and limit degradation

## duration

- 🌀 2-hour batteries ... give you more freedom regarding revenue streams
- 🌀 ... bring more freedom in the optimization strategies
- 🌀 ... keep your battery healthier and future-proof

## degradation

- 🌀 cross-market optimization keeps degradation low
- 🌀 degradation can be considered in optimization strategies
- 🌀 close cooperation also helps keep degradation low

## warranty

- 🌀 terms must be coherent in themselves
- 🌀 cycles must be useable and throughput should not be a backdoor restriction
- 🌀 don't save in the wrong place (e.g. air conditioning)
